

CS 771A: Intro to Machine Learning, IIT Kanpur			Quiz II (29 Mar 2023)	
Name	DIVYANSH CHHABRIA			20 marks
Roll No	210356	Dept.	CSE	Page 1 of 2

**Instructions:**

1. This question paper contains 1 page (2 sides of paper). Please verify.
2. Write your name, roll number, department above in **block letters neatly with ink**.
3. Write your final answers neatly **with a blue/black pen**. Pencil marks may get smudged.
4. Don't overwrite/scratch answers especially in MCQ – such cases will get straight 0 marks.
5. Do not rush to fill in answers. You have enough time to solve this quiz.

**Q1.** The random variable  $X$  is sampled from the uniform distribution over the interval  $[0,1]$  i.e., the probability density function of  $X$  looks like  $p(x) = 1$  if  $x \in [0,1]$  and  $p(x) = 0$  if  $x < 0$  or  $x > 1$ . The r.v.  $Y$  is such that  $\mathbb{E}[X^2 + Y^2] = 1$  and  $\text{Var}[Y] = \frac{5}{9}$ .  $Y$  need not be independent of  $X$  and may have different support than  $X$ . Calculate the following (no derivation needed). **(4 x 1 = 4 marks)**

$\mathbb{E}[X] = 1/2$	$\text{Var}[X] = 1/12$
$\mathbb{E}[Y] = 1/3$	$\mathbb{E}[X + Y] = 5/6$

**Q2.** Melbo is playing a cricket match with his rival Oblem and they use a coin to decide who bats first. The coin has  $\mathbb{P}[\text{Toss} = H] = p$  and  $\mathbb{P}[\text{Toss} = T] = 1 - p$  but Melbo is suspicious that Oblem is cheating and that  $p \neq \frac{1}{2}$ . To promote fair play, Melbo proposes an unconventional process. The coin is tossed twice (independently), and the outcome is decided as follows:

1. If the tosses are HT (in that order), then Melbo bats first (let's call this event  $M$ ).
2. If the tosses are TH (in that order), then Oblem bats first (let's call this event  $O$ ).
3. If the tosses are TT or HH, then a Null result is declared (let's call this event  $N$ ).

The coin is tossed twice. Calculate the following. ( $\neg N$  is the event "not  $N$ ") **(4 x 1 = 4 marks)**

$\mathbb{P}[N] = 2p^2 - 2p + 1$	$\mathbb{P}[M   \neg N] = 1/2$
$\mathbb{P}[O   \neg N] = 1/2$	$\mathbb{P}[M   N] = 0$

**Q3.** Oblem still wants to cheat and proposes another way to decide batting. The Poisson distribution allows us to sample non-negative integers i.e.,  $0, 1, 2, 3, 4, \dots$ . The distribution has a single parameter  $\lambda > 0$  and if  $X$  is a  $\text{Poisson}(\lambda)$  random variable, then for any  $n \in \{0, 1, 2, 3, 4, \dots\}$ , we have

$$\mathbb{P}[X = n] = \frac{\lambda^n \exp(-\lambda)}{n!}$$

Oblem chooses  $\lambda_1, \dots, \lambda_D > 0$ . Then,  $D$  variables  $X_i \sim \text{Poisson}(\lambda_i)$  are independently drawn. If the sum of the drawn variables is equal to zero i.e.,  $\sum_{d \in [D]} X_d = 0$ , then Melbo will bat first (call it event  $M$ ) else Oblem will bat first (call it event  $O$ ). Find expressions for  $\mathbb{P}[O]$  and  $\mathbb{P}[M]$  in terms of  $\lambda_1, \dots, \lambda_D$ . Give brief derivation. Melbo suspects that Oblem may cheat by choosing values of  $\lambda_1, \dots, \lambda_D$  that maximize Oblem's chances of batting first. To avoid this, Melbo imposes a constraint

that the  $\lambda_d$  values must satisfy  $\sum_{d \in [D]} \lambda_d^2 \leq 1$ . Set up an optimization problem to find the values of  $\lambda_1, \dots, \lambda_D > 0$  that maximize Oblem's chances of batting first, subject to Melbo's constraint. Find the value of that probability too. Give brief derivations. Note that  $0! \stackrel{\text{def}}{=} 1, \lambda_d^0 \stackrel{\text{def}}{=} 1$ . (12 marks)

Expressions for win probability in terms of  $\lambda_1, \dots, \lambda_D$  (1 + 1 = 2 marks)

$$\mathbb{P}[O] = 1 - e^{-\sum_{i=1}^D \lambda_i} \quad \mathbb{P}[M] = e^{-\sum_{i=1}^D \lambda_i}$$

Brief derivation for win probability in terms of  $\lambda_1, \dots, \lambda_D$  (2 marks)

We need  $\sum_{d \in [D]} X_d = 0$  but  $X_d \geq 0 \forall d \in [D]$ . Hence  $\forall d \in [D], X_d = 0$  if Melbo bats first.

$$\mathbb{P}[X=0] = \frac{\lambda^0 \cdot e^{-\lambda}}{0!} = e^{-\lambda} \text{ for each draw.}$$

Since all the draws are independent,  $\mathbb{P}[M] = \prod_{i=1}^D \mathbb{P}[X=0 | \text{Drawn from poison with } \lambda_i]$

$$\mathbb{P}[M] = \prod_{i=1}^D e^{-\lambda_i} = e^{-\sum_{i=1}^D \lambda_i}$$

$$\text{Since } \mathbb{P}[O] = 1 - \mathbb{P}[M] = 1 - e^{-\sum_{i=1}^D \lambda_i}$$

Highest win probability for Oblem subject to Melbo's constraint (2 marks)

$$\max_{\lambda_i > 0} \mathbb{P}[O] = 1 - e^{-\sqrt{D}}$$

$$\sum_{d \in [D]} \lambda_d^2 \leq 1$$

The value of  $\lambda_1, \dots, \lambda_D$  that satisfy Melbo's constraint at which Oblem's win probability is maximized (2 marks)

$$[\lambda_1, \dots, \lambda_D] = \left[ \frac{1}{\sqrt{D}}, \frac{1}{\sqrt{D}}, \dots, \frac{1}{\sqrt{D}} \right] \in \mathbb{R}^d.$$

Brief derivation for Oblem's highest win probability subject to Melbo's constraint (4 marks)

$$\mathbb{P}[O] = 1 - e^{-\sum_{i=1}^D \lambda_i}. \text{ We need } \max_{\lambda_i > 0} \mathbb{P}[O] = \max_{\lambda_i > 0} 1 - e^{-\sum_{i \in [D]} \lambda_i} \text{ such that } \sum_{i \in [D]} \lambda_i^2 \leq 1$$

But, this same as saying

$$\arg \max_{\lambda_i > 0} \mathbb{P}[O] = \arg \min_{\lambda_i > 0} e^{-\sum_{i \in [D]} \lambda_i} = \arg \max_{\lambda_i > 0} \left( \sum_{i \in [D]} \lambda_i \right)$$

We have made the use of the fact that  $e^x$  increases monotonically with  $x$ . Hence more the value of  $\sum_{i \in [D]} \lambda_i$ , lesser would be its negative, i.e.  $-\sum_{i \in [D]} \lambda_i$  & lesser would be the exponentiation.

$$[\lambda_1, \dots, \lambda_D] = \arg \max_{\lambda_i > 0} \left( \sum_{i \in [D]} \lambda_i \right) \text{ such that } \sum_{i \in [D]} \lambda_i^2 \leq 1$$

Call  $\vec{\lambda} = [\lambda_1, \lambda_2, \dots, \lambda_D]$ . Call  $\vec{a} = [1, 1, \dots, 1]$ . Note that  $\vec{\lambda}, \vec{a} \in \mathbb{R}^d$ .

By dot product,  $\langle \vec{\lambda}, \vec{a} \rangle = \|\vec{\lambda}\| \cdot \|\vec{a}\| \cdot \cos \theta$  where  $\theta$  is the angle b/w  $\vec{\lambda}$  &  $\vec{a}$

$$\Rightarrow \sum \lambda_i = (\|\vec{\lambda}\| \cos \theta) \sqrt{D} \leq \sqrt{D} \cdot \sum_{i \in [D]} \lambda_i^2 \cdot \cos \theta \leq \sqrt{D} \cdot 1 \cdot 1$$

The equality is achieved if  $\sum \lambda_i^2 = 1$  &  $\cos \theta = 1 \Rightarrow \vec{\lambda} \parallel \vec{a} \Rightarrow \lambda_1 = \lambda_2 = \dots = \lambda_D$ .

$$\text{Since } \|\vec{\lambda}\| = 1 \Rightarrow \lambda_i = \frac{1}{\sqrt{D}}, \max_{\lambda_i > 0} \mathbb{P}[O] = 1 - e^{-\sqrt{D}}$$
