

Set membership question.

Question. Given a regular set  $A \subseteq \Sigma^*$  and  $x \in \Sigma^*$  is  $x \in A$ ?

DFA  $M$ : Simulate  $M$  on the input  $x$

$O(k)$  where  $|x| = k$

NFA  $N$ : Is  $x \in L(N)$ ?

$O(k n^2)$   $|x| = k$ ,  $|Q| = n$ .

Question. Given a CFL  $A \subseteq \Sigma^*$  and  $x \in \Sigma^*$  is  $x \in A$ ?

Algorithm - Due to Cocke, Kasami and Younger

CKY - algorithm.

Runs in cubic-time

Determines for each substring  $y$  of  $x$  the set of all nonterminals that generate  $y$ .

Defined inductively on the length of  $y$ .

Assume  $G$  is in Chomsky normal form.

Example.  $S \rightarrow AB \mid BA \mid SS \mid AC \mid BD$

$A \rightarrow a, B \rightarrow b, C \rightarrow SB, D \rightarrow SA$

$L(G)$  - all strings with equal number of  $a$ 's and  $b$ 's.

Let  $x = aab bab$ . Let  $n = |x|$  (So  $n=6$  here)

	a	a	b	b	a	b
0	1	2	3	4	5	6

For  $0 \leq i < j \leq n$ , let  $x_{ij}$  denote the substring of  $x$  between  $i$  &  $j$ . Ex.  $x_{0,3} = aab$ ,  $x_{2,6} = bbab$   
 $x = x_{0,n}$ .

-	1					
-	-	2				
-	-	-	3			
-	-	-	-	4		
-	-	-	-	-	5	
-	-	-	-	-	-	6

Entry  $T_{ij}$  of  $T$  - Set of non-terminals of  $G$  that generates the substring  $x_{ij}$  of  $x$ .

Define by induction on the length of the substrings.

Example.  $S \rightarrow AB \mid BA \mid SS \mid AC \mid BD$

$A \rightarrow a, B \rightarrow b, C \rightarrow SB, D \rightarrow SA$

$x \rightarrow$  a a b b a b  
0 1 2 3 4 5 6

Substring of length 1.

0						
<u>A</u>	1					
—	<u>A</u>	2				
—	—	<u>B</u>	3			
—	—	—	<u>B</u>	4		
—	—	—	—	<u>A</u>	5	
—	—	—	—	—	<u>B</u>	6

Substring of length 2

0						
<u>A</u>	1					
<u>∅</u>	<u>A</u>	2				
—	<u>S</u>	<u>B</u>	3			
—	—	<u>∅</u>	<u>B</u>	4		
—	—	—	<u>S</u>	<u>A</u>	5	
—	—	—	—	<u>S</u>	<u>B</u>	6

For each  $x_{i,i+2}$  : split the string into two sub strings  $x_{i,i+1}$  and  $x_{i+1,i+2}$ . Select a non-terminal  $X$  from  $T_{i,i+1}$  and  $Y$  from  $T_{i+1,i+2}$ .  
Look for a production  $z \rightarrow XY$  in  $G$ .  
Label  $T_{i,i+2}$  with  $Z$  for each such production.

Example.  $S \rightarrow AB \mid BA \mid SS \mid AC \mid BD$

$A \rightarrow a, B \rightarrow b, C \rightarrow SB, D \rightarrow SA$

$x \rightarrow$  a a b b a b  
0 1 2 3 4 5 6

Substring of length 1.

0						
<u>A</u>	1					
—	<u>A</u>	2				
—	—	<u>B</u>	3			
—	—	—	<u>B</u>	4		
—	—	—	—	<u>A</u>	5	
—	—	—	—	—	<u>B</u>	6

Substring of length  $\geq 3$

0						
<u>A</u>	1					
<u>∅</u>	<u>A</u>	2				
<u>∅</u>	<u>S</u>	<u>B</u>	3			
<u>S</u>	<u>C</u>	<u>∅</u>	<u>B</u>	4		
<u>D</u>	<u>S</u>	<u>∅</u>	<u>S</u>	<u>A</u>	5	
<u>S</u>	<u>C</u>	<u>∅</u>	<u>C</u>	<u>S</u>	<u>B</u>	6

For each  $x_{i,i+2}$ ,  
break into 2 substring  
 $x_{i,i+1}$  &  $x_{i+1,i+2}$   
Select a nonterminal  
 $X$  from  $T_{i,i+1}$  and  
 $Y$  from  $T_{i+1,i+2}$   
Look for production  
 $Z \rightarrow XY$  in  $G$ .  
Label  $T_{i,i+2}$  with  $Z$   
for each such production.

$S \in T_{0,6}$  indicates  $S \xrightarrow{*}_G x_{0,6} = x$  : the input string.  
Therefore  $x \in L(G)$ .

## Algorithm

```
For  $i := 0$  to  $n-1$  do
  begin
     $T_{i,i+1} = \phi$ 
    For  $A \rightarrow a$ , a production in  $G$  do
      if  $a = x_{i,i+1}$  then  $T_{i,i+1} = T_{i,i+1} \cup \{A\}$ 
  end
```

[length 1 strings].  
[Initialise to  $\phi$ ]

```
For  $m := 2$  to  $n$  do
  For  $i := 0$  to  $n-m$  do
    begin
       $T_{i,i+m} := \phi$ 
      For  $j = i+1$  to  $i+m-1$  do
        For  $A \rightarrow BC$ , a production in  $G$  do
          if  $B \in T_{i,j}$  and  $C \in T_{j,i+m}$ 
            then
               $T_{i,i+m} = T_{i,i+m} \cup \{A\}$ 
      end
    end
```

[length  $m \geq 2$ ]  
[for each substring of length  $m$ ]  
[Initialise]  
[All possible splits]

Running Time -  $O(n^3 p)$  where  $p = |P|$  and  $n = |x|$ .

## Ambiguous Grammar.

Consider the grammar  $S \rightarrow S+S \mid S*S \mid (S) \mid A$   
 $A \rightarrow a \mid b$

Consider the string  $a+a*b$

Derivation 1.  $S \rightarrow S+S \rightarrow a+S \rightarrow a+S*S \rightarrow a+a*b$

Derivation 2.  $S \rightarrow S*S \rightarrow S+S*S \rightarrow a+S*S \rightarrow a+a*b$

### Parse Tree

Derivation 1

Derivation 2.

A CFG  $G$  is ambiguous if  $\exists x \in L(G)$  for which there are two different parse trees.

↳ Not two different derivations.

## Definition

A string  $x$  is derived ambiguously in a CFG  $G$  if it has two different leftmost derivation.

Grammar  $G$  is ambiguous if it generates some string ambiguously.

$G$  is unambiguous if  $G$  is not ambiguous.

A CFL  $A \subseteq \Sigma^*$  is inherently ambiguous if  $\forall$  CFG  $G$  s.t.  $L(G) = A$ ,  $G$  is ambiguous.

Note. There are inherently ambiguous CFLs.

DCFLs - CFLs that can be accepted by a DPDA.

DCFLs always admit an unambiguous grammar.

DCFLs  $\subsetneq$  unambiguous CFLs.
